

Task 1.2 – Framework Mapping Exercise

Executive Summary

This document maps a phishing incident across three widely used cybersecurity frameworks: the NIST Cybersecurity Framework (CSF) 2.0, the NICE Workforce Framework for Cybersecurity, and the MITRE ATT&CK; Framework. The objective is to demonstrate how a single cybersecurity incident can be analyzed from governance, workforce, and attacker perspectives.

Sample Incident

An employee receives a phishing email claiming that their Microsoft 365 password is about to expire. The employee clicks the malicious link and enters their username and password. The attacker successfully logs into the employee's Microsoft 365 account and downloads confidential company documents.

NIST CSF 2.0 Mapping

Function	How it Applies
Govern	Cybersecurity policies, password policies, and employee awareness training.
Identify	Identify Microsoft 365 accounts, email systems, and confidential business data as critical assets.
Protect	Use MFA, strong passwords, email filtering, and user awareness training.
Detect	Monitor unusual login attempts and suspicious account activity.
Respond	Disable compromised accounts, reset passwords, and investigate the incident.
Recover	Restore operations and implement lessons learned.

NICE Workforce Roles

Work Role	Responsibility
Security Analyst	Monitors security alerts and identifies suspicious login activity.
Incident Responder	Investigates the phishing incident, contains the attack, and coordinates response.
Security Administrator	Resets passwords, enables MFA, secures user accounts, and implements additional controls.

MITRE ATT&CK Mapping

Tactic	Description
Initial Access	The attacker gains access through a phishing email.
Credential Access	The victim's username and password are stolen.
Persistence	The attacker maintains access to the compromised account.
Collection	The attacker gathers confidential company files and emails.

Conclusion

This exercise demonstrates how a single phishing incident can be viewed through multiple cybersecurity frameworks. NIST CSF focuses on managing cybersecurity risk, NICE identifies the professionals responsible for responding to the incident, and MITRE ATT&CK; explains the attacker's tactics during the intrusion.
